Not all data is created equal.

Data migration and data quality are often treated as technical tasks on SaaS, ERP and CRM programmes: extract, transform, load, then hand it to the systems integrator. That approach treats data as objects to be moved. The records are real business events, and they need to be understood, validated and proven correct in the target system.

Getting data right starts with what the data represents, before anyone designs how to move it. Quality is measured against defined thresholds for completeness, accuracy, duplication and referential integrity, in place of spot checks. It also takes experience and tooling to cleanse, enrich and transform data in volume, at any stage of a programme.

SAASiQ has delivered data workstreams across discovery, design, migration, testing, go-live and post-implementation. That work spans Oracle, SAP, Workday, Microsoft Dynamics, Salesforce and Zoho, and includes cleansing and enrichment that leaves the target system fit for daily operations once the data is loaded.

We provide an independent, data-led assessment and hands-on capability alongside your programme team. That can be a one-off migration, an ongoing data quality regime, or clear ownership of who maintains each data set.
